FORWARD — building to chemistry:

....Higgs Field ->
Higgs Boson: Provides 1% of mass to quarks so that the gluon/Spark of gravity
(1) -(strong force) can bind them and generate the remaining 99% of mass.
(2) -Weak Force (Z Boson):
Quarks (down, down, up):
(3) magnetism -> Neutron ->
(W boson) -->
15 minutes unpaired ->
beta decay ->
(down, up, up)
Proton + electron
(4)(Electromagnetism):
via the (photon boson) ->
Nucleon ->(Neutron, Proton) ->
The foundation of chemistry.

WINDOW OF LIFE -> GRAVITY TAKES OVER:

The foundation of chemistry -> molecules, biology, complexity ->
Window of life (a finite time — as long as the star / planet holds pressure balance) ->
fuel (fusion) runs out -> the balance that kept gravity in check disappears ->
Gravity — until now waiting, the weakest of the forces — takes control and begins
to reverse, one by one, everything the other forces built above.

REVERSE — gravity reverses the sequence:

The foundation of chemistry ->

(4)(Electromagnetism) — reversed:

increasing density/gravity destroys atoms — electrons are pushed out of their

shells into the nucleus, the reverse of photon-mediated bonding ->

Nucleon ->(Neutron, Proton) — electron-degenerate matter [white dwarf] ->

(3) Electron capture (the reverse of beta decay), via the (W boson):

Proton + electron -> Neutron

(up, up, down) -> (down, down, up)

the 15-minute unpaired window is not erased — it marks the same threshold that spans

the whole sequence from neutron star to magnetar, where magnetism (3) dominates ->

Quarks (down, down, up): bound inside the neutron ->

(2) -Weak Force (Z Boson) / deconfinement:

quarks released from hadronic confinement -> quark-gluon plasma ->

(1) -(strong force) loses its binding power — releases the 99% of mass instead of

generating it ->

Higgs Boson: quarks lose the 1% mass, symmetry restored ->

....Higgs Field ($v \to 0$)
